

## *Notch Regulation Of The Immune System*

### **Notch Regulation Of The Immune**

Regulation of gene expression, or gene regulation, includes a wide range of mechanisms that are used by cells to increase or decrease the production of specific gene products (protein or RNA). Sophisticated programs of gene expression are widely observed in biology, for example to trigger developmental pathways, respond to environmental stimuli, or adapt to new food sources.

Transforming growth factor beta 1 or TGF- $\beta$ 1 is a polypeptide member of the transforming growth factor beta superfamily of cytokines. It is a secreted protein that performs many cellular functions, including the control of cell growth, cell proliferation, cell differentiation, and apoptosis. In humans, TGF- $\beta$ 1 is encoded by the TGFB1 gene.

Introduction. The major physiological function of receptors that modulate T cell activation through co-stimulatory or co-inhibitory signals is the prevention of autoimmunity and maintenance of peripheral tolerance (Zhang and Vignali, 2016). When interacting with their physiological ligands, inhibitory co-receptors such as cytotoxic T lymphocyte-associated protein 4 (CTLA4), programmed cell ...

Mature Paneth cells are the exclusive IEC producers of C-type lysozyme, a  $\beta$ -1,4-N-acetylmuramoylhydrolase that cleaves bacterial cell walls (Bevins and Salzman, 2011). Mouse Lyz1 encodes the Paneth cell-specific lysozyme located 5.5 kb away from Lyz2 encoding macrophage lysozyme. By homologous recombination in embryonic stem cells (ESCs), an H2BmCherry-IRES-CreER expression cassette was ...
